## **1. FOREWORD (Informative)**

This standard has been produced by the Antenna Interface Standards Group (AISG) to introduce and define new features and enhancement of the management system for antenna line devices (ALDs) with remote control and monitoring facilities. AISG v3.0 base standard describes the common behaviour of antenna line devices with AISG interfaces and type-specific functionality is defined in subunit type standards. This subunit type standard covers the antenna line devices capable of storing the antenna information.

This standard is independent of previous 3GPP specifications.

**Antenna Interface Standards Group**  
**Subunit Type Standard AISG-ST-ADB**  
**vADB3.1.6.3**

June 29<sup>th</sup> 2023

## **2. SCOPE (Informative)**

AISG v3.0 specifies the standard data interface between a primary, typically a base station, and antenna line devices (ALDs) which are manageable units, usually associated with base station antennas.

The standard is divided into the base standard and several subunit type standards. This subunit type standard document describes the specific behaviour of the Antenna Database (ADB) subunit.

This standard defines the functional behaviour of ADB subunits.

### **2.1. Interpretation (Normative)**

The text of the standard defines explicitly what is required or permitted. Anything that is not explicitly allowed is not permitted.

All statements in this document are normative, unless indicated as informative or example.

For purposes of compliance and AISG interoperability, users should note that the implementation of this subunit type standard is optional. However, once it is selected for inclusion in a product, the entire standard becomes mandatory.

### **3. REFERENCES**

This AISG Standard incorporates provisions from other publications. These are cited in the text and the referenced publications are listed below. Where references are listed with a specific version or release, subsequent amendments or revisions of these publications apply only when specifically incorporated by amendment or revision of this AISG standard. For references listed without a version or release, the latest edition of the publication referred to applies.

#### **4. VERSION COMPLIANCE (Informative)**

The compliance of this standard with different version of AISG v3 baseline standard is defined in [2].

## 5. ABBREVIATIONS (Informative)

Where abbreviations or acronyms are used in this document they have the following meanings:

ADB	Antenna Database
ALD	Antenna Line Device
ID	Identifier
LHC	Left Hand Circular (Polarisation)
MALD	Multi-primary ALD
NGMN	Next Generation Mobile Networks
RET	Remote Electrical Tilt
RF	Radio Frequency
RHC	Right Hand Circular (Polarisation)
SALD	Single-primary ALD
TCC	Time-Consuming Command
Xpol+	Cross Polarisation, slant +45 degrees
Xpol-	Cross Polarisation, slant -45 degrees
3GPP	3 <sup>rd</sup> Generation Partnership Project

## 6. TERMINOLOGY

Where the following terms are used in this document, they have the following meanings:

Antenna port	RF port of the antenna with direction towards the base station.
Array observation direction reference	The direction from which the antenna is viewed to define its polarisation. Possible values are front and back. (Some vendors determine the polarisation by looking at the antenna from the front and others by looking at the antenna from the back, see Annex A).
Array polarisation sense reference	The sense in which the 45 degrees polarisation angle is specified. Vertical axis is used as starting point. Possible values are clockwise or counter-clockwise. This assumes that the antenna is installed in its intended orientation.
Beamwidth	Beamwidth is, in a radiation pattern cut containing the beam peak axis, the angle between the two closest directions with specific radiation intensity. In the case of half-power (3 dB) beamwidth, the radiation intensity is one-half of the maximum value. In this standard beamwidth always refers to half-power beamwidth.
Mechanical bearing	The direction orthogonal to the axis of the antenna assembly, expressed in degrees East of True North (ETN).
Mechanical tilt	Tilt angle of the antenna in the vertical plane. Tilt at an angle below straight and level shall be represented by a positive number (down-tilt), while tilt at an angle above straight and level shall be represented by a negative number. Tilt is reported in decimal degrees, to one decimal place of accuracy, and then multiplied by 10 so that is may be represented by an integer.
Polarisation	Orientation of the electric field vector of the radio wave emitted by a array element of an antenna.

## 7. DEFINITIONS

```
CONSTANT uint16_t NrOfSubunitAlarms ← 0    // Number of subunit alarm types for
                                              // this subunit type
```

# Antenna Interface Standards Group

## Subunit Type Standard AISG-ST-ADB

### vADB3.1.6.3

June 29<sup>th</sup> 2023

## 8. GENERAL ASPECTS

### 8.1. General

An Antenna DataBase (ADB) subunit stores data about the antenna, its contained arrays, installation and site mapping. Any antenna enclosure shall contain one and only one ADB subunit.

It is not allowed to implement an ADB subunit outside an antenna enclosure.

### 8.2. Subunit relationship

An ADB subunit has logical relationship with all ports of the ALD having antenna.

### 8.3. Array element and array ID

An array element is a basic building block of an antenna, defined in [1]. Array elements are differentiated by a array element number. This numbering scheme is vendor specific, but shall not include number 0.

Array ID, defined in [3], may contain several array elements, and it is not used in this subunit type standard. It is used in a label close to an antenna port to help installers to cable the site correctly.

### 8.4. Return codes

This subunit type standard extends the following subunit type specific return codes.

```
Enumeration ReturnCode_t : uint16_t {  
    ADBNotAntennaPort ← 0x0300           // e.g. a RET-port  
}
```

### 8.5. Resumption of operation

The following data shall be retained after reset:

- Antenna installation data
- RFPathIDs and RFPathIDAlias data

### 8.6. Replaceable submodule (Informative)

The behaviour of the antenna model number and antenna serial number fields are vendor specific and it is possible that if a replaceable submodule is exchanged on site, info in these fields changes or is lost. The user may have to maintain this information manually during submodule replacement as it is not mandatory for the vendor to provide a mechanism for reading this information to the new submodule from the antenna.

**Antenna Interface Standards Group  
Subunit Type Standard AISG-ST-ADB  
vADB3.1.6.3**

June 29<sup>th</sup> 2023

## **9. LAYER 1**

All definitions and specifications for ALDs in [1] regarding layer 1 shall be valid for ALDs which contain ADB subunits.

### **9.1. DC power consumption**

This subunit type standard does not define the power consumption of an ADB. ADB is not able to switch the ALD to HighPowerMode.

**Antenna Interface Standards Group  
Subunit Type Standard AISG-ST-ADB  
vADB3.1.6.3**

June 29<sup>th</sup> 2023

## **10. LAYER 2**

All definitions and specifications for ALDs in [1] regarding layer 2 shall be valid for ALDs which contain ADB subunits.

# Antenna Interface Standards Group

## Subunit Type Standard AISG-ST-ADB

### vADB3.1.6.3

June 29<sup>th</sup> 2023

## 11. LAYER 7

An ALD which contains an ADB subunit shall support the command set which is defined in [1] in addition to those commands specified in this standard.

### 11.1. Subunit type

Subunit type	1-octet unsigned integer code
ADB	0x03

Table 11.1-1: Subunit type code

### 11.2. Overview of commands for ADB subunits

The table below shows an overview of all commands used in this ADB subunit type standard.

The following abbreviations are used in the Table 11.2-1: "Command set for ADB subunits".

M Mandatory

O Optional

- Not applicable

Code	Initiator	Subunit	Timeout	TCC	Mandatory for:			Changes the ConnectionState	Changes to HighPowerMode	Minimum required authority
					Primary	SALD	MALD			
<b>ADB commands</b>										
ADB Get Antenna Info	0x0300	Primary	>0	1 s	no	M	M	M	no	no
ADB Get Antenna Port Info	0x0301	Primary	>0	1 s	no	M	M	M	no	no
ADB Get Antenna Array Element Info	0x0302	Primary	>0	1 s	no	M	M	M	no	no
ADB Set Antenna Installation Info	0x0303	Primary	>0	1 s	no	M	M	M	no	no
ADB Get Antenna Installation Info	0x0304	Primary	>0	1 s	no	M	M	M	no	no
<b>Site mapping commands for ADB</b>										
ADB Set RF Path ID To Array Element	0x0305	Primary	>0	1 s	no	O	M	M	no	no
ADB Get RF Path ID From Array Element	0x0306	Primary	>0	1 s	no	O	M	M	no	no

# Antenna Interface Standards Group

## Subunit Type Standard AISG-ST-ADB

### vADB3.1.6.3

June 29<sup>th</sup> 2023

**Table 11.2-1: Command set for ADB subunits**

### 11.3. Bearing representation

The bearing range supported is from 0.0° to +359.9° East of geographical true North. For example bearing 0.0° represents North and 90.0° represents East (see Annex C). The bearing value is expressed in 0.1° units with a range of 0 to +3599.

### 11.4. Mechanical tilt representation

The mechanical tilt range supported is -90.0 – +90.0. Positive tilt values represent downtilt and negative tilt values represent uptilt (see Annex C). The mechanical tilt is expressed in 0.1° units with a range of -900 – +900.

### 11.5. Polarisation representation

Vendors define the polarisation value of an array as either negative or positive slant linear polarisation. [Value: Xpol+ or Xpol-]. This way of defining polarisation is not comparable between different vendors due to the differences in the polarisation references they use.

This standard defines a way to compose a vendor independent and compatible slant polarisation description by introducing two references that indicate the way that a vendor is defining polarisation. By combining the polarisation value and these two references, i.e. array observation direction reference and array polarisation sense reference, all specified by the manufacturer during ALD production and available through the ADB commands, vendor independent and comparable cross polarisation information can be derived. This method is only used for slant linear polarisation.

Array observation direction reference: Array polarisation is defined looking at the antenna from the front or from the back [Value: Front or Back].

Array polarisation sense reference: Array slant polarisation is defined referring to vertical. +45 degree polarisation may be defined as being oriented 45 degrees clockwise from vertical or 45 degrees counter-clockwise from vertical. [Value: CW or CCW].

Conversion from vendor specific polarisation to comparable polarisation is done using the table 11.5-1.

Polarisation Value	Array Observation Direction Reference	Array Polarisation Sense Reference	Comparable Polarisation ID
Xpol+	Front	CW	A
Xpol-	Front	CW	B
Xpol+	Back	CW	B
Xpol-	Back	CW	A
Xpol+	Front	CCW	B
Xpol-	Front	CCW	A
Xpol+	Back	CCW	A
Xpol-	Back	CCW	B

**Table 11.5-1: Polarisation conversion**

For examples of this method see Annex A.

#### 11.6.4. ADB Set Antenna Installation Info

##### Description (Informative):

This command stores installation data and corresponding provenances in non-volatile memory.

The bitfield InstallationDataToBeStored controls which data fields are stored. The same bit in the bitfield controls the storage of the length of the data (where applicable), the data itself and its provenance as follows:

Bit value 1: Corresponding data is stored in non-volatile memory.

Bit value 0: Corresponding data is stored in non-volatile memory.

When the bit value is 0, the corresponding data fields are not sent.

NOTE: Prior to version ADB3.1.6, the behaviour was different.

##### Message format:

```
Bitfield DataToBeStored_t : uint8_t {
    SectorID          : Bit 0
    InstallationNotes : Bit 1
    MechanicalBearing : Bit 2
    MechanicalTilt    : Bit 3
}
```

## ANNEX A: Direction definitions for polarisation

This annex shows how the directions from which the antenna is viewed to define its polarisation are defined.

**Figure A-1: Array observation reference directions (Back or Front)**

**Figure A-2: Array polarisation sense reference (CW (Clockwise) and CCW (Counterclockwise))**

**Antenna Interface Standards Group  
Subunit Type Standard AISG-ST-ADB  
vADB3.1.6.3**

June 29<sup>th</sup> 2023

**ANNEX B: Polarisation comparison example**

Vendor X defines slant linear polarisation by looking the antenna from the back and uses clockwise array polarisation sense reference.

Vendor Y defines slant linear polarisation by looking the antenna from the front and uses clockwise array polarisation sense reference.

Vendor X has indicated that Array 1 polarisation is Xpol+. ADB Get Antenna Array Info reports that the vendor uses array observation direction reference "Back" and array polarisation sense reference "CW".

Vendor Y has indicated that Array 1 polarisation is Xpol-. ADB Get Antenna Array Info reports that the vendor uses array observation direction reference "Front" and array polarisation sense reference "CW".

Conversion using table 11.5-1:

Vendor X comparable polarisation is B.

Vendor Y comparable polarisation is B.
